Explanation:

Box 1: Azure AD V2.0 endpoint - Microsoft identity platform is an evolution of the Azure Active Directory (Azure AD) developer

platform. It allows developers to build applications that sign in all Microsoft identities and get tokens to call Microsoft APIs, such as Microsoft Graph, or APIs that developers have built. The Microsoft identity platform consists of: OAuth 2.0 and OpenID Connect standard-compliant authentication service that enables developers to authenticate any Microsoft identity, including:

Work or school accounts (provisioned through Azure AD) Personal Microsoft accounts (such as Skype, Xbox, and Outlook.com) Social or local accounts (via Azure AD B2C) Box 2: Azure AD B2C tenant - Azure Active Directory B2C provides business-to-customer identity as a service. Your customers use their preferred social, enterprise, or local account identities to get single sign-on access to your applications and APIs. Azure Active Directory B2C (Azure AD B2C) integrates directly with Azure Multi-Factor Authentication so that you can add a second layer of security to sign-up and sign-in experiences in your applications.

NEW QUESTION: 3

Sie haben einen Failover-Cluster mit dem Namen Cluster1.

Eine virtuelle Maschine mit dem Namen VM1 ist eine hochverfügbare virtuelle Maschine, die auf Cluster1 ausgeführt wird. Eine benutzerdefinierte Anwendung mit dem Namen App1 wird auf VM1 ausgeführt.

Sie müssen die Überwachung auf VM1 konfigurieren. Wenn App1 dem Anwendungsereignisprotokoll einen Fehlereintrag hinzufügt, sollte VM1 automatisch neu gestartet und auf einen anderen Clusterknoten verschoben werden.

Welches Tool solltest du verwenden?

- A. Failover-Cluster-Manager
- B. Server Manager
- C. Ressourcenmonitor
- D. Hyper-V-Manager

Answer: A

Explanation:

Do you have a large number of virtualized workloads in your cluster? Have you been looking for a solution that allows you to detect if any of the virtualized workloads in your cluster are behaving abnormally? Would you like the cluster service to take recovery actions when these workloads are in an unhealthy state? In Windows Server 2012/2016, there is a great new feature, in Failover Clustering called "VM Monitoring", which does exactly that - it allows you monitor the health state of applications that are running within a virtual machine and then reports that to the host level so that it can take recovery actions.

VM Monitoring can be easily configured using the Failover Cluster Manager through the following steps:
