* Files to download:

IOS-Sxxx-CLI.pkg: Signature package - download the latest signature package.

realm-cisco.pub.key.txt: Public Crypto key - this is the crypto key used by IOS IPS

NEW QUESTION: 3

Your network contains an Active Directory domain named contoso.com. The domain contains a main office and a branch office. An Active Directory site exists for each office. All domain controllers run Windows Server 2012. The domain contains two domain controllers. The domain controllers are configured as shown in the following table.

DC1 hosts an Active Directory-integrated zone for contoso.com. You add the DNS Server server role to DC2. You discover that the contoso.com DNS zone fails to replicate to DC2.

You verify that the domain, schema, and configuration naming contexts replicate from DC1 to DC2.

You need to ensure that DC2 replicates the contoso.com zone by using Active Directory replication.

Which tool should you use?

- A. Ntdsutil
- B. DNS Manager
- C. Active Directory Domains and Trusts
- D. Active Directory Users and Computers

Answer: B

Explanation:

The primary tool that you use to manage DNS servers is DNS Manager, the DNS snap-in in Microsoft Management Console (MMC), which appears as DNS in Administrative Tools on the Start menu. You can use DNS Manager along with other snap-ins in MMC, further integrating DNS administration into your total network management. It is also available in Server Manager on computers with the DNS Server role installed. You can use DNS Manager to perform the following basic administrative server tasks:

- *Performing initial configuration of a new DNS server.

- *Connecting to and managing a local DNS server on the same computer or remote DNS servers on other computers.

- *Adding and removing forward and reverse lookup zones, as necessary.

- *Adding, removing, and updating resource records in zones.

- *Modifying how zones are stored and replicated between servers.

- *Modifying how servers process queries and handle dynamic updates.

Modifying security for specific zones or resource records.

In addition, you can also use DNS Manager to perform the following tasks:

- *Perform maintenance on the server. You can start, stop, pause, or resume the server or manually update server data files.

- *Monitor the contents of the server cache and, as necessary, clear it.

- *Tune advanced server options.

Configure and perform aging and scavenging of stale resource records that are stored by the server.

Reference: DNS Tools

NEW QUESTION: 4

Company XYZ has transferred all of the corporate servers, including web servers, to a cloud hosting provider to reduce costs. All of the servers are running unpatched, outdated versions of Apache. Furthermore, the corporate financial data is also hosted by the cloud services provider, but it is encrypted when not in use. Only the DNS server is configured to audit user and administrator actions and logging is disabled on the other virtual machines. Given this scenario, which of the

following is the MOST significant risk to the system?
A. Financial data is processed without being encrypted.
B. All servers are unpatched and running old versions.
C. Server services have been virtualized and outsourced.
D. Logging is disabled on critical servers.

Answer: B
