NEW QUESTION: 1

Don, a student, came across a gaming app in a third-party app store and installed it. Subsequently, all the legitimate apps in his smartphone were replaced by deceptive applications that appeared legitimate. He also received many advertisements on his smartphone after installing the app. What is the attack performed on Don in the above scenario?

- A. Agent Smith attack
- B. SIM card attack
- C. Clickjacking
- D. SMS phishing attack

Answer: C

Explanation:

Clickjacking is an attack that tricks a user into clicking a webpage element which is invisible or disguised as another element. This will cause users to unwittingly download malware, visit malicious sites, provide credentials or sensitive information, transfer money, or purchase products online. Typically, clickjacking is performed by displaying an invisible page or HTML element, inside an iframe, on top of the page the user sees. The user believes they're clicking the visible page but actually they're clicking an invisible element within the additional page transposed on top of it. The invisible page might be a malicious page, or a legitimate page the user didn't shall visit - for instance, a page on the user's banking site that authorizes the transfer of cash. There are several variations of the clickjacking attack, such as: * Likejacking - a way during which the Facebook "Like" button is manipulated, causing users to "like" a page they really didn't shall like. *

Cursorjacking - a UI redressing technique that changes the cursor for the position the user perceives to a different position. Cursorjacking relies on vulnerabilities in Flash and therefore the Firefox browser, which have now been fixed.

Clickjacking attack example

1. The attacker creates a beautiful page which promises to offer the user a free trip to Tahiti. 2. within the background the attacker checks if the user is logged into his banking site and if so, loads the screen that permits transfer of funds, using query parameters to insert the attacker's bank details into the shape . 3. The bank transfer page is displayed in an invisible iframe above the free gift page, with the "Confirm Transfer" button exactly aligned over the "Receive Gift" button visible to the user. 4. The user visits the page and clicks the "Book My Free Trip" button. 5. actually the user is clicking on the invisible iframe, and has clicked the "Confirm Transfer" button. Funds are transferred to the attacker. 6. The user is redirected to a page with information about the free gift (not knowing what happened within the background).

This example illustrates that, during a clickjacking attack, the malicious action (on the bank website, during this case) can't be traced back to the attacker because the user performed it while being legitimately signed into their own account.

Clickjacking mitigation

There are two general ways to defend against clickjacking: * Client-side methods - the foremost common is named Frame Busting. Client-side methods are often effective in some cases, but are considered to not be a best practice, because they will be easily bypassed. * Server-side methods - the foremost common is X-Frame-Options. Server-side methods are recommended by security experts as an efficient thanks to defend against clickjacking.

NEW QUESTION: 2

You are administering a database that supports a DSS workload. Automatic Shared Memory Management is enabled for the database instance. Users issue queries to perform large soft operations and complain about degraded performance of the queries. On investigation, you notice that the queries are performing multipass work area executions and the I/O contention on one of the temporary tablespaces is very high.

Which two can be possible resolutions for this issue? (Choose two.)

- A. Create another temporary tablespace and assign it to users.
- B. Increase the value of thePGA_AGGREGATE_TARGETparameter.
- C. Increase the size of the large pool.
- D. Create a temporary tablespace group and assign it to users.
- E. Increase the value of thePGA_AGGREGATE_LIMITparameter.
- F. Enable temporary undo.

Answer: C,E

NEW QUESTION: 3

An IS auditor who was involved in designing an organization's business continuity plan (BCP) has been assigned to audit the plan. The IS auditor should:

- A. decline the assignment.
- B. inform management of the possible conflict of interest after completing the audit assignment.
- C. inform the business continuity planning (BCP) team of the possible conflict of interest prior to beginning the assignment.
- D. communicate the possibility of conflict of interest to management prior to starting the assignment.

Answer: D

Explanation:

Communicating the possibility of a conflict of interest to management prior to starting the assignment is the correct answer. A possible conflict of interest, likely to affect the auditor's independence, should be brought to the attention of management prior to starting the assignment. Declining the assignment is not the correct answer because the assignment could be accepted after obtaining management approval. Informing management of the possible conflict of interest after completion of the audit assignment is not correct because approval should be obtained prior to commencement and not after the completion of the assignment. Informing the business continuity planning (BCP) team of the possible conflict of interest prior to starting of the assignment is not the correct answer since the BCP team would not have the authority to decide on this issue.
