**NEW QUESTION: 1**

What principle focuses on the uniqueness of separate objects that must be joined together to perform a task? It is sometimes referred to as "what each must bring" and joined together when getting access or decrypting a file. Each of which does not reveal the other?

- A. Split knowledge
- B. Need to know
- C. Dual control
- D. Separation of duties

**Answer: A**

Explanation:

Split knowledge involves encryption keys being separated into two components, each of which does not reveal the other. Split knowledge is the

other complementary access control principle to dual control.

In cryptographic terms, one could say dual control and split knowledge are properly implemented if no one person has access to or knowledge of the content of the complete cryptographic key being protected by the two processes.

The sound implementation of dual control and split knowledge in a cryptographic environment

necessarily means that the quickest way to break the key would be through the best attack known for the algorithm of that key. The principles of dual control and split knowledge primarily apply to access to plaintext keys.

Access to cryptographic keys used for encrypting and decrypting data or access to keys that are encrypted under a master key (which may or may not be maintained under dual control and split knowledge) do not require dual control and split knowledge. Dual control and split knowledge can be summed up as the determination of any part of a key being protected must require the collusion between two or more persons with each supplying unique cryptographic materials that must be joined together to access the protected key.

Any feasible method to violate the axiom means that the principles of dual control and split knowledge are not being upheld.

Split knowledge is the unique "what each must bring" and joined together when implementing dual control. To illustrate, a box containing petty cash is secured by one combination lock and one keyed lock. One employee is given the combination to the combo lock and another employee has possession of the correct key to the keyed lock.

In order to get the cash out of the box both employees must be present at the cash box at the same time. One cannot open the box without the other. This is the aspect of dual control.

On the other hand, split knowledge is exemplified here by the different objects (the combination to the combo lock and the correct physical key), both of which are unique and necessary, that each brings to the meeting. Split knowledge focuses on the uniqueness of separate objects that must be joined together. Dual control has to do with forcing the collusion of at least two or more persons to combine their split knowledge to gain access to an asset. Both split knowledge and dual control complement each other and are necessary functions that implement the segregation of duties in high integrity cryptographic environments.

The following are incorrect answers: Dual control is a procedure that uses two or more entities (usually persons) operating in concert to protect a system resource, such that no single entity acting alone can access that resource. Dual control is implemented as a security procedure that requires two or more persons to come together and collude to complete a process. In a cryptographic system the two (or more) persons would each supply a unique key, that when taken together,

performs a cryptographic process. Split knowledge is the other complementary access control principle to dual control. Separation of duties - The practice of dividing the steps in a system function among different individuals, so as to keep a single individual from subverting the process.

The need-to-know principle requires a user having necessity for access to, knowledge of, or possession of specific information required to perform official tasks or services.

#### **NEW QUESTION: 2**

You have a service template to deploy Appl. You are evaluating the use of Network Load Balancing (NLB) for the front-end servers used by Appl.

You need to recommend which component must be added to the service template.

What should you recommend?

- A. A capability profile
- B. A VIP template
- C. A host profile
- D. Guest OS profile

**Answer: B**

Explanation:

Explanation/Reference:

Explanation:

The company is developing an application named Appl. Appl is a multi-tier application that will be sold as a service to customers.

Each instance of Appl is comprised of the following three tiers:

A web front end

A middle tier that uses Windows Communication Foundation (WCF)

A Microsoft SQL Server 2008 R2 database on the back end

Each tier will be hosted on one or more virtual machines.

Multiple tiers cannot coexist on the same virtual machine.

When customers purchase Appl, they can select from one of the following service levels:

Standard: Uses a single instance of each virtual machine required by Appl. If a virtual machine

becomes unresponsive, the virtual machine must be restarted.

Enterprise: Uses multiple instances of each virtual machine required by Appl to provide high-

availability and fault tolerance.

All virtual hard disk (VHD) files for Appl will be stored in a file share. The VHDs must be available if a server fails.

You plan to deploy an application named App2. App2 is comprised of the following two tiers:

A web front end

A dedicated SQL Server 2008 R2 database on the back end

App2 will be hosted on a set of virtual machines in a Hyper-V cluster in the Miami office. The virtual machines will use dynamic IP addresses. A copy of the App2 virtual machines will be maintained in the Seattle office.

App2 will be used by users from a partner company named Trey Research. Trey Research has a single Active Directory domain named treyresearch.com. Treyresearch.com contains a server that has the Active Directory Federation Services server role and all of the Active Directory Federation Services (AD FS) role services installed.

You can use the following procedure to create a virtual IP (VIP) template for a hardware load balancer. A virtual IP template contains load balancer-related configuration settings for a specific type of network traffic. For example, you could create a template that specifies the load balancing behavior for HTTPS traffic on a specific load balancer manufacturer and model. These templates represent the best practices from a load balancer configuration standpoint.
