B.

`aws-elasticache.amazonaws.com`

C.

`aws-elasticache.amazonaws.com`

D.

`aws-elasticache.amazonaws.com`

**Answer: B**

Explanation:

Explanation

In Amazon ElastiCache, the number of cache nodes in the cluster is a key factor in the availability of your cluster running Memcached. The failure of a single cache node can have an impact on the availability of your application and the load on your back-end database while ElastiCache provisions a replacement for the failed cache node and it get repopulated. You can reduce this potential availability impact by spreading your memory and compute capacity over a larger number of cache nodes, each with smaller capacity, rather than using a fewer number of high capacity nodes.
