Explanation:

NEW QUESTION: 2

Router A(AS 65000)-----Router C(AS

65005)-----AS 65010

| |

-----Router B(AS 65005)-----

Router C

AS 65010 Path

65005 65010 65010

Local Preference 200

Med 200

Router B

AS 65010 Path

65005 65010

Med 200

Refer to the exhibit. Router A is connected as a BGP neighbor to routers B and C.

Which path does router A use to get to AS 65010?

- A. through router B because the default local preference is 500 and higher than router C
- B. through router C because it has a higher local preference
- C. through router B because it has the shortest AS path
- D. will load balance because both routers have the same Med value

Answer: B

NEW QUESTION: 3

How can failback of a recovered virtual machine in vSphere Replication be performed?

- A. No action required, because failback is automatically performed to the source site.
- B. Configure a new replication in the reverse direction at the target site.
- C. Disable or Stop the virtual machine replication on the source site.
- D. Power off and unregister the virtual machine on the target site.

Answer: B

Explanation:

Explanation/Reference:

Explanation:

Failback of Virtual Machines in vSphere Replication

Failback of virtual machines is a manual task in a vSphere Replication.

After performing a successful recovery from the primary site to the secondary site, you can perform failback. You manually configure a new replication in the reverse direction, that is, from the secondary site to the primary site. The disks of the primary site are used as replication seeds, so that vSphere Replication only synchronizes the changes made to the .vmdk files. Before you configure the reverse replication, you must manually unregister the virtual machine from the inventory on the primary site.
