Answer: A

NEW QUESTION: 2

You are developing a web page that consumes a Windows Communication Foundation (WCF) service. The page includes the following code segment.

```
var xhr = new XMLHttpRequest();
```

The page uses the `xhrHandler()` method to listen for changes to the request status of the WCF service calls. It uses the `xmlToJavaScript()` method to convert the response from the WCF service to a JavaScript object.

The `xhrHandler()` method must be called automatically each time the request status changes.

You need to add the event handler to the request object.

Which line of code should you use?

- A. `xhr.onCallback = xhrHandler;`
- B. `xhr.status = xhrHandler;`
- C. `xhr.onreadystatechange = xhrHandler;`
- D. `xhr.readyState = xhrHandler;`

Answer: C

Explanation:

`/ onreadystatechange`: Sets or retrieves the event handler for asynchronous requests.

Specifies a reference to an event handler for an event that fires at every state change

`readyState`

Returns the state of the object as follows:

* 0 = uninitialized - `open()` has not yet been called.

* 1 = open - `send()` has not yet been called.

* 2 = sent - `send()` has been called, headers and status are available.

* 3 = receiving - Downloading, `responseText` holds partial data (although this functionality is not available in IE [3])

* 4 = loaded - Done.

`/ Example (assuming that there is a function handler()):`

```
var oReq = getXMLHttpRequest();
```

```
if (oReq != null) {
```

```
oReq.open("GET", "http://localhost/test.xml", true);
```

```
oReq.onreadystatechange = handler;
```

```
oReq.send();
```
